

Abstract (in conjunction with figure 11)

In the case of a (cigarette) pack with a shell (10) and slide (11), the range of movement of the slide (11) within the shell (10) is limited, in particular by stops. These stops are formed, on the one hand, on a stop tab (30) and, on the other hand, by a recess (34) in the shell (10). The stops help to define a closed position of the slide (11) and an open position.
